

Space Weather Forecast

Issued on Monday, 28 November 2022 at 01:24 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales <https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales>

Space Weather Forecast Headline: Increasing Chance of Minor Geomagnetic Storm (G1) intervals through the period.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity has been Very Low in the past 24 hours, with no discernible flares. There are currently four sunspots on the Earth-facing disk, all of which are small, simple and apparently stable. No new Earth-directed coronal mass ejections have been observed in available imagery.

Solar Wind / Geomagnetic Activity: Solar wind parameters, as measured by ACE and DSCOVR at L1, were indicative of waning coronal hole high speed stream influences. Solar wind speeds have decreased from Elevated-Strong levels to Slightly Elevated. The interplanetary magnetic field was moderate at first, peaking at 26/1300 UTC, before becoming weak again. The north south component remained weak. Geomagnetic activity was largely Unsettled (Kp 3), until becoming Quiet from 27/0600 UTC.

Energetic Particles / Solar Radiation: No solar radiation storms were observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Solar activity is expected to remain Low or Very Low, with a chance of isolated Common-class flares.

Solar Wind / Geomagnetic Activity: A coronal mass ejection 24th may arrive at Earth on day 1 or early day 2 (28th-29th). There are two coronal hole high speed streams that may arrive at earth in coming days, the first is expected from day 2 (29 Nov), with Elevated solar wind speeds and the second is expected to arrive either late on day 3 or more likely into day 4 (30th-1st), with speeds perhaps becoming briefly Strong.

Geomagnetic activity is expected to be mainly Quiet to Unsettled with Active intervals and a chance of G1/Minor storm intervals each day due to either coronal mass ejection or coronal hole high speed stream effects. This risk increases on day 4 due to the arrival of CH51/+.

Energetic Particles / Solar Radiation: No solar radiation storms are currently expected during the forecast period.

Geomagnetic Storms:

Geo-Magnetic Storm	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC)	Day 2 (00-24 UTC)	Day 3 (00-24 UTC)	Day 4 (00-24 UTC)
Probability (Exceedance)			(%)	(%)	(%)	(%)
Minor or Moderate	G1 to G2	No	30	30	30	40
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC)	Day 2 (00-24 UTC)	Day 3 (00-24 UTC)	Day 4 (00-24 UTC)
Probability			(%)	(%)	(%)	(%)
Active	R1-R2 M Class	No	5	5	5	5
Very Active	R3 to R5 X	No	1	1	1	1

Solar Radiation Storms - (High Energy Protons):

Radiation Storms	Level (cm ⁻² sr ⁻¹ s ⁻¹)	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC)	Day 2 (00-24 UTC)	Day 3 (00-24 UTC)	Day 4 (00-24 UTC)
Probability (Exceedance)			(%)	(%)	(%)	(%)
Active	≥ S1	No	1	1	1	1
Very Active	≥ S3 *	No	1	1	1	1

* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = cm⁻²sr⁻¹s⁻¹)
